

# Axe

## Ice Dissolver for Cooling Appliances

The Ice Dissolver for Cooling Appliances Axe is a product of rapid application and effectiveness to dissolve the ice and facilitate its removal. Its direct use on the surfaces of the cooling appliance slows down the formation of new ice.

No need to rinse.

Its components are suitable for the contact with food.

We recommend using Axe even before running a clearing, hygienization or sanitisation intervention, to allow a direct action of the treatment on the surfaces involved.

Instructions: Abundantly spray Axe on the whole surface to be treated, let it act for a few minutes, and facilitate the detachment of the ice with a more or less vigorous mechanical action depending on the amount to be removed.

If the ice is particularly thick, repeat the operation several times and, if necessary, create holes (paying attention to possible elements or pipes that can be damaged) within which introduce large amounts of Axe. If necessary, extend the time of effectiveness of the product before proceeding to the mechanical action.

Axe must be used by experienced professionals, provided with the specific personal protective equipments.
